The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

Foreword

The 1993 Baccalaureate and Beyond Longitudinal Study (B&B:93) sampled students who completed bachelor's degrees in the 1992–93 academic year. The first followup survey, conducted in 1994, provides information on the activities of these bachelor's degree recipients in the year after graduation. Compared with previous studies of high school age cohorts, B&B:93 offers several advantages for studying graduates' experiences as undergraduates, their graduate education, and their labor market experience. First, B&B:93 begins with a nationally representative sample of bachelor's degree recipients, regardless of graduates' age at degree completion. With the proliferation of part-time attendance and the increasing number of college students who are older than the traditional 18- to 22-year-old population, this affords a more representative cross-section of bachelor's degree completers than would be possible with a sample based on an age cohort. Second, by sampling degree completers B&B:93 avoids sources of sample attenuation that occur with high school cohorts (not all members of a high school cohort attend college; those who do attend differ in timing, intensity, and continuity of enrollment; and not all who attend college complete a bachelor's degree).

In particular, B&B:93 offers an important opportunity to study college graduates' participation in the teaching profession. For many years the National Center for Education Statistics (NCES) conducted the Recent College Graduates Study (RCG) to provide information on college graduates' entry into and preparation for teaching. B&B:93 goes beyond RCG by allowing examination of not only graduates' participation in teaching one year after graduation but also their movement into and out of the profession over time. With the proliferation of alternative certification programs and increasing interest in teaching among established professionals in other fields, study of who enters teaching, when, and why becomes more important to policymakers and educators. This report lays the groundwork for future studies by presenting data on who, among 1992–93 graduates, entered teaching and on their academic experiences as undergraduates. Analyses of future data collections will study both the persistence in teaching, or lack thereof, among those who entered just out of college as well as later entry by other graduates.

Acknowledgments

Many people contributed to the production of this report, and the authors would like to thank several in particular. At MPR Associates, special thanks go to Simone Figueroa and Barbara Kridl for watchful management of production matters in general and the glossary in particular; Andrea Livingston and Karyn Madden for their careful editing of the manuscript; Mary Sukkestad for turning computer output into not only readable but also attractive tables and graphics, with the able assistance of Laura Mihailoff and Connie Yin; and Ellen Liebman for her quick and always competent programming. Alex McCormick and Laura Horn provided invaluable assistance in conceptualizing the report and ensuring the quality of the statistics presented therein, as well as moral support. Vicky Dingler and Sanjay Kothari did an admirable job of managing data that were always under revision.

Several U.S. Department of Education staff also made important contributions to this report. Sharon Bobbitt of the Office of Reform Assistance and Dissemination participated in early and important decisions regarding the groups of interest in this report. Paula Knepper, the B&B:93 COTR at NCES, not only participated in those decisions but also contributed to the quality of the report through all its revisions. C. Dennis Carroll and Mary Frase, also of NCES, reviewed the report and made many suggestions that improved the final product. The authors also appreciated the useful comments of Robert Burton and Peter Stowe of NCES, Donna Gollnick of the National Council for Accreditation of Teacher Education, and Meredith Ludwig of the Association of Schools, Colleges, and Universities.

Undergraduate Academic Experiences of 1992–93 College Graduates

Introduction

In the early 1980s, two concerns about elementary and secondary school teachers drew the attention of policymakers and the public at large: the supply of teachers, particularly whether the United States would experience a shortage of teachers; and the academic ability and qualifications of those who became teachers. Some warned that fewer talented college graduates were entering or remaining in teaching than in previous generations, and that in the face of shortages schools would be forced to hire less qualified teachers in order to fill classrooms.¹ Others were less concerned with a shortage of teachers than with teacher qualifications, particularly in light of school reform efforts. Did teachers have the knowledge and skills necessary to teach the material reformers demanded in the ways that reformers wanted?²

These concerns have raised questions and contributed to debate regarding teacher preparation, licensure, and the conditions of teaching. Should requirements for entry into teacher education programs, such as test scores or grade point averages, be increased? What should potential teachers study in teacher education programs? Should certification requirements for new teachers demand more rigorous courses, particularly in science and mathematics, or include professional examinations such as the National Teacher Examination (NTE)? Would increased teacher salaries lead those with stronger academic qualifications to choose teaching? Would mechanisms for differentiating teachers according to their expertise encourage teachers to remain in the profession?³

In addition to concerns about teacher supply and quality, educators, policymakers, and the public have also been concerned for some time about the growing discrepancy between the proportions of minority school children and minority teachers. The importance of increasing the proportion of teachers who are of minority background has been argued from a number of vantage points. Many assert that minority children will be more motivated to succeed in school if they see minority adults—teachers—who have succeeded in school and earned positions of responsibility.

⁵A.V. Adair, *The Illusion of Black Progress* (Lanham, MD: University Press of America, 1984); Patricia A. Graham, "Black Teachers: A Drastically Scarce Resource," *Phi Delta Kappan* 68 (8) (1987): 598-605; J. Stewart, K.J. Meier, R.M. LaFollette, and R.E. England, "In Quest of Role Models: Change in Black Teacher Representation in Urban School Districts, 1968–1986," *Journal of Negro Education* 58 (1989): 140-152.

Beyond the call for minority role models, others have suggested that minority teachers are more likely to teach in ways that promote the achievement of minority students. Because minority teachers have participated in minority groups' unique cultures, these authors argue, they are more likely than white teachers both to understand the norms and styles of communication of minority children and to structure their classrooms and lessons in ways that are congruent with minority cultures. Whether practiced by minority or majority teachers, culturally relevant pedagogy, as it is termed, has been found to be more successful with minority children than traditional classroom routines. Therefore, increasing the proportion of teachers who are likely to practice it is expected to improve minority students' achievement.⁶

Thus, attracting college graduates with strong academic skills and preparation, particularly those of minority racial—ethnic backgrounds, into teaching and retaining them in the profession are important policy concerns, and the 1993 Baccalaureate and Beyond study (B&B:93) offers an important opportunity to begin to study these issues both now and into the 21st century. The data collected in 1994 (B&B:93/94), the first wave of B&B:93 data collection, permit analysis of new college graduates' participation in teacher preparation and in teaching. In the future, B&B:93 data will allow researchers to compare those who entered teaching immediately after graduating from college with those who enter later, determine when and why teachers leave the profession, and study patterns of reentry into teaching.

Thus far, B&B:93/94 data indicate that patterns of early participation in teaching among subgroups of 1992–93 college graduates were similar to those of previous cohorts. As the essay that follows demonstrates, women and white graduates were more likely than men and minority graduates both to have taken any of several steps toward teaching and to have expected to teach in the future. Although graduates with college entrance examination scores in the top quartile were less likely than other college graduates to take steps toward teaching, graduates with higher GPAs were more likely to enter the teacher pipeline. Further analysis of the B&B:93 data indicate that this apparent discrepancy may be explained by differences in course-taking patterns: graduates more inclined to teach were more likely to have taken education courses, in which most students earned higher grades, and less likely to have taken courses in advanced mathematics or calculus, in which most students earned lower grades.

After describing the teacher pipeline, through which college graduates enter and exit teaching at various points in time, the essay focuses on 1992–93 college graduates who were first-time entrants into the teacher pipeline. Its first section examines the rate of entry into and progress through the teacher pipeline among 1992–93 college graduates of varying demographic characteristics, asking "Who took steps toward a teaching career?" In the second section the academic experiences of those who taught, only prepared to teach, or were only considering teaching are compared with those of other recent graduates, asking questions such as "How did

⁶S.H. King, "The Limited Presence of African-American Teachers," *Review of Educational Research* 63 (2) (Summer 1993): 115–149. Others have argued that the empirical evidence, as yet, does not warrant these claims (See, for example, C.J. Cizek, "On the Limited Presence of African American Teachers: An Assessment of Research, Synthesis, and Policy Implications," *Review of Educational Research* 65 (1) (Spring 1995): 78–92).

⁷In this report the study as a whole, including present and future data collections, is referred to as B&B:93, and the followup data collection conducted in 1994 is referred to as B&B:93/94.

those more inclined to teach compare academically with those less so inclined?"

The essay concludes by looking at 1992–93 graduates' expectations for teaching in the future. In particular, the essay discusses the relationship between new teachers' experiences in the classroom and their plans to continue teaching in the near and long terms. Additional data regarding teaching among the class of 1992–93 are presented in the table compendium following the essay.

What is the "Teacher Pipeline"?

Unlike professions that require years of technical training, college graduates may become elementary or secondary teachers or leave teaching for other occupations with relative ease. Some students decide that they want to teach before they enter college or while they are undergraduates, and therefore prepare for teaching while in college by fulfilling the education course and student teaching requirements necessary for certification to teach in their state. Although education remains the most popular undergraduate major among new teachers, an increasing number of college students who prepare to teach major in an academic discipline and fulfill the education course and student teaching requirements for certification in addition to the degree requirements of their undergraduate major.⁸

Graduates who prepared to teach must then consider whether to teach immediately following graduation. Some do choose to teach immediately, while others wait to gain other job experience or obtain further education, often a master's degree, before teaching. Still others decide that teaching is not what they want to do and enter other occupations. Also, those who do teach may choose to leave after as little as 1 year.

In contrast with those who prepared to teach, most undergraduates are either uninterested in teaching or less certain that they would choose teaching as a long-term career. Some college graduates who do not prepare to teach pursue teaching positions in private schools, which often do not require certification for employment as teachers. Others obtain emergency or temporary teaching certificates in order to teach in public schools for a year or two, usually while taking the coursework necessary to obtain regular certification. Moreover, in the last decade or so alternative certification programs have been designed to make the transition into teaching even easier for college graduates who did not prepare to teach as undergraduates.⁹

⁸U.S. Department of Education, National Center for Education Statistics, *New Teachers in the Job Market*, 1991 *Update*, NCES 93–392 (Washington, DC: 1993).

⁹C. Emily Feistrizer and David T. Chester, *Alternative Teacher Certification: A State-by-State Analysis*, 1995 (Santa Fe, NM: National Center for Education Information, 1995).

Thus, the supply of educators that staff the nation's classrooms depends upon decisions regarding teaching as an occupation that college students and graduates make not only while undergraduates but throughout the course of their adult lives.¹⁰

B&B:93 will examine, in this report and in subsequent analyses, the class of 1992–93 as they enter, leave, and reenter the teaching profession in the years following their college graduation. Although the majority of 1992–93 graduates were first-time bachelor's degree recipients and were too young to have taught before receiving their 1992–93 degrees, others may have prepared to teach over the course of earning an earlier bachelor's degree or taught previously with or without certification. These graduates had, at the time they received their degrees, already entered the teacher pipeline and had varying experiences of it at different points of time. So as not to confound decades-old experiences of teaching or teacher preparation with contemporary experiences, it was important to be able to distinguish new from previous entrants.

Consequently, the first step was to identify those 1992–93 bachelor's degree recipients who had taught before completing the 1992–93 degree or who had been certified to teach 1 year or more before receiving the 1992–93 bachelor's degree. Overall, of those who received bachelor's degrees in 1992–93, only about 3 percent had taught before obtaining their 1992–93 degrees or had been certified 1 year or more before receiving these degrees (figure 1). Given the small size of the sample representing these graduates, it was not possible to study these graduates separately from the others, and therefore they were excluded from the study.

The remaining 97 percent of graduates were considered eligible to enter the teacher pipeline, that is, to take some step toward entering the teaching profession, and these graduates make up the population discussed in this report. One year after receiving the baccalaureate, graduates could have entered the pipeline in one of three ways:

- by teaching in the year following receipt of the 1992–93 bachelor's degree;
- by having prepared to teach, either by student teaching while at the degree-granting institution, or by earning a teaching certificate less than 1 year before college graduation or within 1 year after it;
- by reporting, 1 year after receiving the 1992–93 bachelor's degree, that they were considering teaching.

Figure 1—Percentage distributions of 1992–93 bachelor's degree recipients by whether they were pipeline-eligible, by whether they were in the teacher pipeline, and by their status in the teacher pipeline: 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1993 Baccalaureate and Beyond Longitudinal Study First Followup (B&B:93/94), Data Analysis System.

As figure 1 also illustrates, by 1994 approximately one-quarter of pipeline-eligible 1992–93 graduates had entered the teacher pipeline. Of those who had entered, 30 percent had done so by teaching in that year (teachers), 17 percent by preparing to teach but not teaching (prepared only), and 53 percent by reporting in 1994 that they were only considering teaching (considering). The remaining three-quarters of the graduating class did not report that they were considering teaching, had prepared to teach, or had taught, and therefore for the purposes of this analysis are considered outside the teacher pipeline.

Analyses of data to be collected in the future will study the rates at which each group of pipeline-eligible graduates enters the teacher pipeline and the pattern of entry, departure, and reentry within each group, recognizing that those who were not considering teaching in 1994 may enter at a later date. However, because these graduates were not considering teaching in 1994,

this analysis excludes them from the teacher pipeline and distinguishes among the three pipeline groups in order to make comparisons among groups who in 1994 were more or less inclined to teach. Thus, the remainder of this essay discusses the demographic and academic characteristics of these three groups of graduates, comparing them with each other and with those who had not entered the pipeline.

Who Entered the Teacher Pipeline?

Historically, most teachers have been women and/or from white, non-Hispanic backgrounds, and discussion has centered around whether these limitations on the demographic makeup of teachers constitute a problem, and, if so, how to rectify it. ¹² The racial—ethnic makeup of the teaching pool in particular has often been the subject of analysis and debate in the past, and a discussion of race—ethnicity is therefore central to this section of the report.

Background

Data from multiple sources confirm many authors' claims that the disparity between the proportions of students and teachers who are of minority background is increasing. The Elementary and Secondary School Civil Rights Survey, the Schools and Staffing Survey (SASS), and U.S. Department of Education data cited by the American Association of Colleges for Teacher Education (AACTE) indicate that the proportion of U.S. school children who are of minority background has increased in recent years. The SASS data are the most recent of these, and they show that approximately 32 percent of children in the nation's schools were of minority racial or ethnic background in 1993–94. According to a time series analysis of Civil Rights Surveys, the percentage of the nation's students who were of minority background increased 8 percentage points between 1976 and 1990. The surveys of the series and they show that approximately 32 percent of children in the nation's schools were of minority racial or ethnic background in 1993–94. According to a time series analysis of Civil Rights

At the same time, the SASS data, NCES's Recent College Graduates Study (RCG), and data on teacher education enrollments collected by AACTE all indicate that the proportions of practicing teachers, newly qualified teachers, and would-be teachers who are of minority backgrounds are less than half that of minority schoolchildren. Moreover, whereas the proportion of minority children has increased, the proportion of minority teachers has been notably stable.

¹³The Schools and Staffing Survey (SASS) samples schools, teachers, principals, and school districts nationwide to gather data on the programs offered and people who work in the nation's schools. It provides a comprehensive data source on teachers in elementary and secondary schools, including information on their preservice education and professional development.

¹⁴American Association of Colleges for Teacher Education, *Teacher Education Pipeline III*; U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile*, 1993–94, NCES 96-124 (Washington, DC), forthcoming.

¹⁵U.S. Department of Education, National Center for Education Statistics, *The Condition of Education 1994*, NCES 94-149 (Washington, DC: 1994).

Surveys conducted by the National Education Association between 1971 and 1991 indicate that the proportion of teachers who were white declined by only 1.5 percent, from 88.3 percent to 86.8 percent, during this time period. SASS and AACTE data also indicate that although the proportions of minority teachers and education students have increased since the late 1980s, that increase remains slight (about 1 percent) and that the proportions of minority teachers and education students hover around 13 percent.¹⁶

Thus the questions of why and when some groups of college students choose to teach while others do not has become increasingly important to those interested in achieving a diverse teaching staff. Although small sample sizes prevent some apparent differences from being statistically significant, in general, the data discussed below indicate that Asian/Pacific Islander and black, non-Hispanic graduates were less inclined to teach than were white, non-Hispanic or Hispanic graduates. Also, continuing historical trends, women were more likely than men to be attracted to teaching.

Entering the Teacher Pipeline

Differences by gender and race–ethnicity are apparent when one examines 1992–93 college graduates' first point of entry into a teaching career. For example, Asians and Pacific Islanders were significantly less likely than other racial–ethnic groups to be in the teacher pipeline (table 1). Ten percent of Asian/Pacific Islander graduates, compared with 27–34 percent of other graduates, were at least considering teaching in 1994. The gender difference was equally striking: whereas 1 in 3 women eligible to enter the teacher pipeline had entered it, 1 in 5 eligible men had done so.

Location in the Pipeline

While black, non-Hispanic graduates were no less likely than any other racial—ethnic group to enter the teacher pipeline, they were more apt to enter it by only considering teaching than by preparing to teach or teaching. To illustrate, 74 percent of black, non-Hispanic graduates in the pipeline were only considering teaching, significantly more than their Hispanic (54 percent) and white, non-Hispanic (50 percent) peers (table 1 and figure 2). Furthermore, black, non-Hispanic graduates in the pipeline prepared to teach half as often as their Hispanic or white, non-Hispanic peers (17 percent versus 35–43 percent) (table 2).

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1993 Baccalaureate and Beyond Longitudinal Study First Followup (B&B:93/94), Data Analysis System.

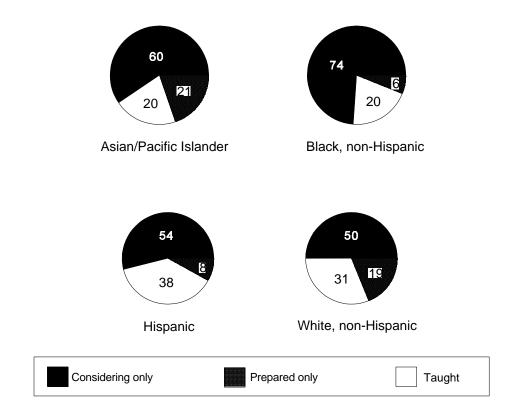

In contrast, the rate at which graduates in the pipeline applied for teaching positions, the rate at which those who applied for teaching positions received offers, and the rate at which those who received offers accepted them did not vary with their racial—ethnic backgrounds (table 2). Thus, although both Asians or Pacific Islanders and black, non-Hispanics were less likely to teach, the points at which these groups opted out of teaching differed. Asians and Pacific Islanders were less likely to be in the teacher pipeline in the first place. Black, non-Hispanic graduates were no less likely than members of other racial—ethnic groups to consider teaching as an occupation, but were less likely to pursue it by preparing to teach or by teaching in the year following college graduation.

Gender differences in preparing to teach, applying for teaching positions, and teaching were consistent with teaching's history as a female-dominated profession. Forty-seven percent of women in the pipeline prepared to teach, compared with 28 percent of men (table 2), and 1 in 3 women in the pipeline actually taught, whereas about 1 in 4 men did so (table 1). As was the case for race—ethnicity, there were no significant differences between men and women in the percentage who received teaching job offers or the percentage who accepted them.

¹Excludes those who either taught in elementary or secondary schools before receiving the 1992–93 bachelor's degree or had been certified to teach 1 year or more before receiving the 1992–93 bachelor's degree.

²Graduates were defined as having entered the teacher pipeline if they had first taught since receiving the 1992–93 bachelor's degree, prepared to teach during or since the 1992–93 degree, or were considering teaching at the time of the B&B:93/94 interview.

Schools in Which They Taught

As discussed above, who became a teacher—or was even considering teaching—varied according to several demographic characteristics. Not surprisingly then, the sector and level of the schools in which 1992–93 college graduates taught also varied with graduates' race—ethnicity and gender. Overall, about 84 percent of 1992–93 graduates who taught worked in public schools, and the balance worked in private schools (table 3), figures that are comparable to the distribution of teachers nationally in 1993–94. Minority graduates were more likely than white graduates to teach in public schools. Two-thirds of women who taught worked in elementary schools, compared with two-fifths of men. Similarly, one-quarter of women taught in secondary schools, whereas over half of men who taught worked in secondary schools.

¹Includes those who prepared to teach regardless of whether they had taught. Does not include those who taught but did not prepare to teach.

²Includes applications for positions as teacher aides and substitute teachers. Because these positions were not counted as

²Includes applications for positions as teacher aides and substitute teachers. Because these positions were not counted as "teaching" in the pipeline variable, respondents who were offered and accepted these positions were not categorized as having taught in the pipeline variable.

¹⁷ Estimates from the 1993–94 administration of the Schools and Staffing Survey (SASS) indicate that about 87 percent of teachers taught in public schools and 13 percent in private schools.

Expectations for the Future

New teachers exit the teacher pipeline at various times and for various reasons, including pursuing further education or changing careers altogether. The longitudinal nature of B&B:93 will allow tracking of these graduates' moves in and out of the teaching profession, but in the meantime, their expectations provide an early indicator of their commitment to teaching as a profession.

In general, new teachers' expectations for teaching in the future followed patterns similar to those observed regarding their entrance into teaching in the year after receiving their bachelor's degrees. For example, about 62 percent of black, non-Hispanic new teachers expected to be teaching in 2 years, whereas 78 percent of Hispanic teachers and 76 percent of white, non-Hispanic new teachers had this expectation (table 4). Likewise, when asked about their plans regarding teaching in the long term, 25 percent of black, non-Hispanic graduates in the pipeline responded that they expected to be teaching, compared with 45 percent of their white, non-Hispanic peers. Similarly, among nonteachers in the teacher pipeline, Asian/Pacific Islanders and black, non-Hispanics were less likely than white, non-Hispanics to expect to teach in the long term.

Differences between men's and women's expectations for teaching in the future were also consistent with those found with respect to entering the pipeline and teaching. Whereas about half of the women in the teacher pipeline expected to be teaching in 2 years or in the long term, about 30 percent of men expected to be teaching at either of these points in time. Among new

^{*}Although 33 percent of black, non-Hispanic graduates entered the pipeline, only 20 percent taught, so tables that include only teachers have too few black, non-Hispanics to report estimates.

teachers, 81 percent of women expected to be teaching in 2 years, compared with 62 percent of men. Women were also more likely than men to expect to teach in the long term (69 percent compared with 52 percent).

Given these expectations, it appears that among this cohort of college graduates, the historical trends in minority and female participation in teaching are not likely to change. Analyses of future B&B:93 data will indicate just how accurate these new graduates' expectations for the future were, and whether graduates who begin teaching at a later point have similar demographic characteristics to those who began teaching within one year of their degree completion. Let us now turn from the question of who entered the teacher pipeline to how those who did enter compared with those who did not in terms of their undergraduate academic experiences.

Table 4—Of 1992–93 bachelor's degree recipients in the teacher pipeline, percentage who planned to be teaching in two years and in the long term, by gender and race–ethnicity: 1994

Undergraduate Academic Experiences and Teaching

Background

Although the academic achievement and ability of teachers have been questioned for well over 100 years, the early 1980s occasioned a renewed interest in the topic. ¹⁸ In the last decade or so, this issue has been studied from several vantage points. Studies have compared the

¹⁸W. Timothy Weaver, *America's Teacher Quality Problem: Alternatives for Reform* (New York: Praeger Publishers, 1983).

achievement test scores and grade point averages of college students who were interested in teaching with those of other students, education majors with noneducation majors, teachers with nonteachers, and those who continued to teach with those who left the profession. The findings have been fairly consistent: college students interested in teaching, teacher education students, teachers, and those who remain in teaching tend to have somewhat lower scores on standardized tests—including the ACT or SAT, the NTE, and the High School and Beyond (HS&B) achievement tests—than their counterparts who were less inclined toward teaching. On the other hand, studies that employ high school or college grade point averages as the measure of achievement consistently report that those more inclined toward teaching achieve at levels equal to or higher than those less inclined.¹⁹

In addition to possible shortages of teachers with high academic achievement, policymakers and researchers have been concerned in particular about the potential for a shortage of teachers who have studied high-level mathematics and science. Because college graduates with degrees in mathematics, computer science, and the natural sciences have greater earning power in private enterprise than they do as schoolteachers, it is believed, these graduates are less likely to be interested in teaching (especially as a long-term career), to prepare to teach, to enter teaching, or to remain in teaching for an extended period of time.²⁰

As the data presented in the remainder of this section indicate, earlier findings regarding the academic achievement of those who were considering teaching, had prepared to teach, or had taught were not contradicted by B&B:93/94 data. At several points along the teacher pipeline, those more inclined toward teaching tended to have lower college entrance examination scores and higher GPAs than did those less inclined toward teaching. The data also indicate that this apparent discrepancy in findings may be accounted for, at least in part, by differences in course taking: those who taught, only prepared to teach, or were only considering teaching were more likely than other graduates to have taken education courses, less likely to have taken advanced mathematics and calculus courses, and tended to take fewer courses in science or engineering. Because grades in education courses tended to be higher than those in advanced mathematics, calculus, science, and engineering courses, the mix of courses taken by those inclined to teach tended to result in higher GPAs than the mix taken by those who were not so inclined.

Hanushek and Richard R. Pace, "Who Chooses to Teach (and Why)?" *Economics of Education Review* 14 (2) (1995): 101–117; Richard J. Murnane, Judith D. Singer, John B. Willett, James J. Kemple, and Randall J. Olsen, *Who Will Teach? Policies That Matter* (Cambridge, MA: Harvard University Press, 1991); Phillip C. Schlechty and Victor S. Vance, "Recruitment, Selection, and Retention: The Shape of the Teaching Force"; Janet C. Sweeney, Richard D. Warren, and Mari R. Kemis, "Teacher Education Graduates at One Year Following Graduation—An Examination of Differences Between Those Who Entered Teaching and Those Who Did Not" (Paper presented at the annual meeting of the Mid-Western Educational Research Association, Chicago, 1990); Weaver, *America's Teacher Ouality Problem.*

²⁰Russell W. Rumberger, "The Impact of Salary Differentials on Teacher Shortages and Turnover: The Case of Mathematics and Science Teachers," *Economics of Education Review* 6 (4) (1987): 389–399.

This section explicates these findings by comparing 1992–93 graduates who took various steps toward teaching, and who taught in different types of schools, on several aspects of their undergraduate academic careers: their major fields of study, the types of postsecondary institutions in which they began postsecondary education and completed their bachelor's degrees, their entrance examination scores, their grade point averages, the number of credits they earned in various subject areas, and the grades associated with those credits.

Undergraduate Major

Although a useful indicator of the propensity to teach, majoring in education was quite distinct from preparing to teach. Education majors were far more likely than graduates who majored in other fields to enter the teacher pipeline (figure 3 and table 5). However, 1 year after graduation a significant proportion—nearly one quarter—of graduates who majored in education had neither prepared to teach nor taught and were not even considering teaching (table 5).²¹ In addition, significant proportions of graduates in other fields—about one-third of humanities majors and one-fifth of other liberal arts majors—were considering teaching in 1994, even if they had neither prepared nor taught.

Table 5—Percentage of 1992–93 bachelor's degree recipients who entered the teacher pipeline; and of pipeline entrants, percentage distribution according to status in the pipeline, by baccalaureate degree major: 1994

	Percent entered teacher pipeline ²	I	Pipeline entrants	
		Considering only	Prepared only	Taught

Other	16.9	75.3	10.2	14.5

¹Excludes those who either taught in elementary or secondary schools before receiving the 1992–93 bachelor's degree or had been certified to teach 1 year or more before receiving the 1992–93 bachelor's degree.

NOTE: Details may not sum to 100 percent due to rounding.

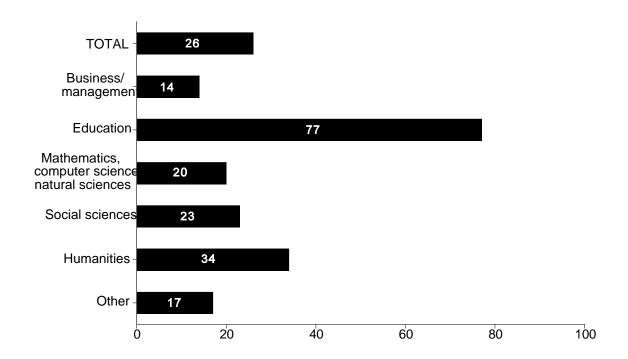

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1993 Baccalaureate and Beyond Longitudinal Study First Followup (B&B:93/94), Data Analysis System.

²Graduates were defined as having entered the teacher pipeline if they had first taught since receiving the 1992–93 bachelor's degree, prepared to teach during or since the 1992–93 degree, or were considering teaching at the time of the B&B:93/94 interview.

²¹Many of these graduates may pursue graduate study in education, teach at non-elementary/secondary levels, or become administrators, counselors, or education policymakers rather than classroom teachers.

Once in the teacher pipeline, just over half of education majors had taught and another one-third had only prepared to teach (table 5). In contrast, no more than 23 percent of graduates in other majors had taught and no more than 12 percent had only prepared to teach. Given these differences, when comparing education majors with graduates who majored in other fields it is important to keep in mind both that many education majors either had not entered the pipeline or were only considering teaching and that a number of those who majored in other fields had either taught or prepared to teach by 1994.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1993 Baccalaureate and Beyond Longitudinal Study First Followup (B&B:93/94), Data Analysis System.

Types of Postsecondary Institutions Attended

In general, new teachers began their postsecondary careers in and graduated from the same types of postsecondary institutions as other graduates. Most graduates first attended a 4-year institution after high school: 55 percent began in public 4-year institutions, 28 percent in private 4-year institutions, and 17 percent in less-than-4-year institutions. These proportions did not vary

^{*}Excludes bachelor's degree recipients who had taught before receiving 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

with graduates' interest in teaching, and varied little with their undergraduate fields of study (table 6).²²

²²Beyond a greater likelihood among humanities graduates to have begun in private 4-year institutions, college major was not associated with the postsecondary institutions that graduates first attended after high school.

Among teachers, however, the type of institution in which they began college was associated with both the sector of schools in which they taught and their plans to teach in the future. For instance, whereas more than one-fifth of new graduates who taught in public schools first attended less-than-4-year institutions, about one-tenth of their classmates who taught in private schools did. Similarly, private school teachers were more likely than public school teachers to have begun in private 4-year institutions (44 percent versus 19 percent). In addition, new teachers who planned to teach in the future (both in 2 years and in the long term) were less likely than those who did not expect to remain in the classroom to have begun their postsecondary careers in private 4-year institutions.

Unlike the first postsecondary institution attended after high school, the type of institution from which graduates received their degrees did vary slightly with pipeline status. Between 29 and 38 percent of graduates who had only prepared to teach or had taught received their degrees from public nondoctorate-granting institutions, compared with 21 percent of graduates who were not in the teacher pipeline (table 7).

²Includes graduates of private, for-profit institutions and institutions of unknown type (i.e., 1992–93 bachelor's degree recipients who were sampled from an institution other than the degree-granting one).

Also, in contrast to their classmates who were in the teacher pipeline, those who were not in the pipeline were more likely to have graduated from public doctorate-granting institutions. These differences are hardly surprising, given that public nondoctorate-granting institutions often began as normal schools or teachers' colleges and are more likely than other types of institutions to offer teacher preparation programs.

As with the first institution attended, however, the most consistent differences were observed between groups of teachers. One-third of public school teachers graduated from public nondoctorate-granting institutions, compared with one-fifth of private school teachers. At the same time private school teachers were more likely to have graduated from private not-for-profit nondoctorate-granting institutions. Again, new teachers who expected to teach in the future differed from short-term teachers: those who expected to be teaching in 2 years and in the long term were more likely to have graduated from nondoctorate-granting public institutions and less likely to have graduated from doctorate-granting private institutions.

Thus, to some degree those in the teacher pipeline attended different types of institutions from those outside the pipeline. More consistent differences in the types of institutions attended occurred among teachers, however. Those who expected to teach in the future and those who taught in public schools more often attended public institutions, particularly public nondoctorate-granting 4-year institutions. It appears, therefore, that those more committed to teaching were more likely to attend institutions that prepared large numbers of teachers.

College Entrance Examination Scores²³

Those graduates who were more inclined to teach were consistently less likely than graduates who were less inclined to be in the top quartile of entrance exam scores and often were more likely to be in the bottom quartile. For example, although one-quarter of those not in the teacher pipeline had college entrance exam scores in the top quartile, about one-fifth of those who taught had scores in the top quartile (figure 4 and table 8). Similarly, those who majored in education were less likely than liberal arts majors (those who majored in mathematics, computer science, or the natural sciences; the social sciences; or the humanities) to have scored in the top quartile among B&B:93 graduates.

Among 1992–93 graduates who taught, the kinds of schools in which they taught and the level at which they taught were also related to their college entrance exam scores. Compared with those who taught in public schools (17 percent), nearly twice as many of those who taught in private schools (33 percent) scored in the top quartile of B&B graduates (table 8). In addition, new teachers who taught in secondary schools were more likely than their peers in elementary schools to have scored in the top quartile (29 percent compared with 12 percent). Secondary teachers in the class of 1992–93 scored in the top quartile at the same rate as their peers who were not in the teacher pipeline.

20

²³For the purposes of this analysis, students' SAT scores were used when available. ACT scores were used if SAT scores were not available. Quartiles were determined relative to B&B graduates, not the population of SAT/ACT test-takers. See the glossary for further details on this variable.

Finally, whether they had taught or not, graduates in the pipeline who expected to be teaching in 2 years were less likely to have scores in the top quartile than were those who did not expect to be teaching in 2 years. And among new teachers, those who planned to continue teaching in the future were more likely than those who did not to be in the bottom quartile. Thus, at each step toward a long-term career in teaching, those who were more inclined to teach scored less well than those less inclined.

Figure 4—Percentage distribution of 1992–93 bachelor's degree recipients according to college entrance examination score quartile, by status in teacher pipeline: 1994

^{*}Excludes bachelor's degree recipients who had taught before receiving 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

NOTE: Self-reported entrance examination scores were available for 65–70 percent of new bachelor's degree recipients. There were no differences in the proportion of graduates with examination scores by pipeline status.

Undergraduate Grade Point Averages

Comparison of undergraduate grade point averages (GPAs) is more complicated than comparison of test scores. Unlike entrance examination scores, where the metric is normed on a national sample, course grades are distributed relative to students in particular classes taught by individual faculty in various institutions. Because grades are not subject to uniform standards across faculty, fields of study, or institutions, comparing them can be problematic. Furthermore, this variation is compounded by differences in the combinations of courses taken by students in different institutions and different fields of study. Therefore, when comparing the GPAs of various groups of students it is important to take into account other variables that are related to GPA that also vary consistently among those groups, such as their fields of study, the courses they took, and their achievement in those courses. Although multivariate techniques provide the best methods of accounting for the influence of other variables, such analyses are beyond the scope of this report. Therefore, in order to examine differences among 1992–93 graduates at various points along the teacher pipeline as accurately as possible, this essay includes information regarding those important covariates.

Cumulative GPA did vary by location in the teacher pipeline. Teachers and those who had only prepared to teach had higher cumulative GPAs than did both those who had not entered the pipeline and those who were only considering teaching (table 9). In addition, with the exception of humanities majors, education majors had higher cumulative GPAs than their peers in the other undergraduate major categories. However, there were no differences among teachers' GPAs by the sector or level of their schools or by their expectations for teaching in the future.

A similar pattern emerges from graduates' GPAs in their major fields of study. Those who taught and those who only prepared to teach had GPAs in their major ranging from 3.44 to 3.48, in contrast to the major GPAs of those who were not in the pipeline or who were only considering teaching, whose major GPAs ranged from 3.26 to 3.29 (figure 5 and table 10). As observed with cumulative GPAs, education majors tended to have higher GPAs in their major field than did their classmates in other fields, with the exception of the humanities.

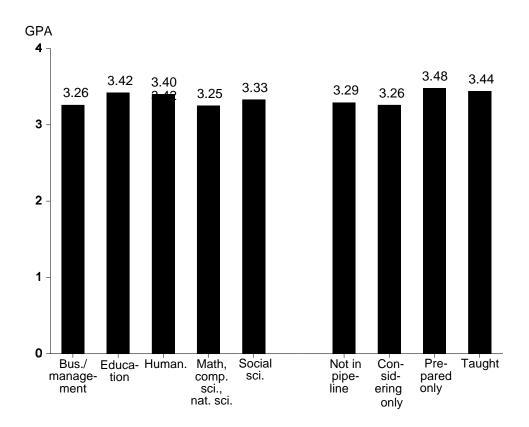

Because education majors had higher GPAs in their majors than students in some other majors, one might suspect, as others have suggested, that GPAs are a flawed measure of achievement and that this flaw accounts for the contradictory findings on entrance examination scores and GPAs, that is, that those inclined to teach had both lower entrance exam scores and higher GPAs than other graduates. Specifically, one might argue that teachers and those who only prepared to teach had higher GPAs not because they achieved more academically but because the courses they took in college were less rigorous than those taken by other college graduates.

For example, when one looks at the undergraduate majors of graduates in different locations in the pipeline, one finds that undergraduate major may well be related to the GPA differences between those more inclined to teach and those less inclined. As noted above, majoring in education was not synonymous with preparing to teach or teaching, but it was related. Sixty-four percent of those who only prepared to teach had majored in education (table 11). Three-quarters of elementary school teachers and about half of secondary teachers majored in education, while many secondary level teachers majored in the arts and sciences: 11 percent in the humanities, 11 percent in the natural sciences, 10 percent in mathematics or computer science, and 9 percent in the social sciences. Moreover, teachers who planned to teach in the future were especially likely to have majored in education—about 70 percent did.

Thus, because those more inclined to teach were more likely to major in education and education majors tended to have both higher GPAs and lower scores on the SAT or ACT, undergraduate major may account for some of the discrepancy between entrance examination scores and grades. However, given the diversity in majors among graduates in the pipeline, it is necessary to look further at the courses they took and the grades they earned in those courses.

Undergraduate Course Taking

The B&B:93/94 data collection included not only the telephone interview of 1992–93 graduates, but also respondents' transcripts from the degree-granting institution. For most students, these transcripts reflect the courses credited toward the 1992–93 bachelor's degree, but for students who transferred to the degree granting-institutions from other institutions, these transcripts may not be complete records of their undergraduate course-taking experience.

¹Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

²Includes literature, foreign languages, and fine and performing arts; for more detail see appendix A.

NOTE: Details may not sum to 100 percent due to rounding. Breakdowns may not average to totals due to item nonresponse.

Between 34 and 38 percent of graduates either a) reported having begun postsecondary education at an institution other than the degree-granting institution or b) had records of courses taken at other institutions on their transcripts from the degree-granting institutions.²⁴ Therefore, the estimates of courses taken, credits earned, and GPAs in the fields presented below must be read with some caution. Nevertheless, they can be used to determine whether there were systematic differences in course taking among groups of graduates.

Remedial Course Taking 25

The proportion of graduates whose transcripts indicated that they had taken at least one precollegiate mathematics course while in college was positively associated with the propensity to teach.²⁶ Fifteen percent of graduates in the teacher pipeline had taken at least one precollegiate mathematics course, compared with 12 percent of their classmates who were not in the teacher pipeline (table 12). Differences were also apparent by undergraduate major: 18 percent of education majors had taken a precollegiate mathematics course, compared with 9 percent of mathematics/computer science/natural science majors, and 11 percent among both humanities and social science majors. Public school teachers were more likely than private school teachers to have taken a precollegiate mathematics course. Among those who received credit for precollegiate mathematics, no differences were observed in the number of credits received or in the grade point averages in these courses.

Course taking in remedial English was similar only in that education majors were more likely than social science or humanities majors to have taken at least one course (13 percent of education majors compared with 7 percent of both social science and humanities majors) (table 12). Although there were no differences in the number of credits earned in remedial English courses, teachers who earned credit in remedial English earned slightly higher grades in those courses than graduates who were not in the teacher pipeline.

To the extent that they received credit and higher grades for these courses than their classmates received for other courses, those who took remedial courses may have increased their overall GPAs relative to those of their classmates despite lower achievement levels in mathematics or English. However, given the data discussed above, remedial course taking does not entirely explain the discrepancy between findings on entrance examination scores and GPAs. There was only a 3 percent difference between pipeline and nonpipeline graduates in the proportion who had taken precollegiate mathematics, no difference in the proportion who had taken remedial English, and no differences between teachers and their classmates outside the pipeline. However, those who majored in education were more likely than those who majored in other fields to take remedial courses in both mathematics and English.

²⁴U.S. Department of Education, National Center for Education Statistics, *A Descriptive Summary of 1992–93 Bachelor's Degree Recipients: One Year Later*.

²⁵Because some postsecondary institutions do not grant credit for remedial coursework, this report addresses remedial course taking by examining the proportion of graduates who had taken at least one course regardless of credit granted. With respect to nonremedial course taking, the report discusses credits earned so as not to include courses attempted but not passed.

²⁶Details concerning definitions of "precollegiate mathematics," "remedial English," and other types of courses can be found in the technical appendix.

Table 12—Percentage of 1992–93 bachelor's degree recipients whose undergraduate transcripts' recorded at least one course attempted in precollegiate mathematics or remedial English, average number of credits earned in each field, and average GPA in each field, by selected teaching-related characteristics: 1994

Course Taking in Advanced Mathematics or Calculus

Were those inclined to teach more or less likely to have earned credit in advanced mathematics or calculus?²⁷ As table 13 illustrates, about one-fifth of those in the pipeline had earned advanced mathematics or calculus credit, compared with about one-third of those not in the pipeline.

¹Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

²Transcripts were collected from degree-granting institutions only and may not include postsecondary credits earned at other institutions. See appendix B for details on transcript data.

³Average credits/GPA for those with some credit in each field.

²⁷ The reader is reminded that by "had taken" it is meant "had a record of having taken on the transcript from the degree-granting institution." Respondents whose transcripts did not indicate courses in any of the subjects discussed may well have taken such courses at another institution.

Table 13—Percentage of 1992-93 bachelor's degree recipients whose undergraduate transcripts recorded credit earned in advanced mathematics or calculus and science or engineering, average number of credits earned in each field, and average GPA in each field, by selected teaching-related characteristics: 1994

[—]Too few cases for a reliable estimate.

¹Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

²Transcripts were collected from degree-granting institutions only and may not include postsecondary credits earned at other

institutions. See appendix B for details on transcript data.

However, secondary school teachers were no less likely than those not in the pipeline to have earned credit in these fields. This appears to be due to course taking among mathematics, computer science, and natural science teachers: 52 percent of mathematics/computer science teachers had taken these courses, as had 23 percent of their colleagues in the natural sciences. Education majors were less likely than business and mathematics/computer science/natural science majors to have earned credit in advanced mathematics or calculus.

When teachers took courses in these subjects, they tended to earn more credits than their classmates who were not in the teacher pipeline. Teachers earned about 10 credits in advanced mathematics or calculus, compared with 7 credits among those who were not in the pipeline. Grades earned in these courses did not vary with teaching status, and education majors earned about the same grades as their classmates in other majors.

Course Taking in Science or Engineering

Unlike advanced mathematics or calculus, the proportion of graduates who earned credit in science or engineering did not vary with teaching status. About three-quarters of graduates earned credit in these fields regardless of teaching status (table 13). Those who taught did tend to earn fewer credits (12 on average) than either those outside the pipeline (20 credits) or those who were only considering teaching (17 credits). However, those in the pipeline tended to earn about the same grades in science and engineering courses as those not in the pipeline.

Although education majors were less likely than those who majored in mathematics, computer science, or the natural sciences to have earned credit in science and engineering, 78 percent of education majors did earn these credits. Moreover, education majors earned no fewer credits in science or engineering than social science or humanities majors and more than business majors. Education majors did earn lower grades in science and engineering courses than mathematics, computer science, or natural science majors, but about the same grades as their classmates in other majors.

Course Taking in the Humanities and Social Sciences

Course taking in the humanities and social sciences among graduates who taught, only prepared to teach, or were only considering teaching also differed from that of their counterparts outside the teaching pipeline. Although the proportion of graduates who earned any credit in either the humanities or social sciences did not vary with teaching status or undergraduate major, differences were observed in the number of credits earned by those inside and outside the teacher pipeline and in the grades they received. Those who were only considering teaching earned about 2.8 more credits in the humanities than those outside the pipeline, although no other differences were observed by pipeline status (table 14). Education majors earned about 11 fewer humanities credits than humanities majors, but about 7 more than both business and management majors and mathematics, computer science, and natural sciences majors. Graduates' grades in humanities courses did not vary with their major fields of study or with their teaching status.

Table 14—Percentage of 1992-93 bachelor's degree recipients whose undergraduate transcripts' recorded credit earned in the humanities, social sciences, and education, average number of credits earned in each field, and average GPA in each field, by selected teaching-related characteristics: 1994

⁻Too few cases for a reliable estimate.

¹Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

²Transcripts were collected from degree-granting institutions only and may not include postsecondary credits earned at other

institutions. See appendix B for details on transcript data.

In the social sciences, graduates outside the pipeline earned about 4 more credits than those who taught, but because the other two groups within the pipeline earned more credits than those who taught, overall there was no difference between those inside and those outside the pipeline. Education majors earned about 23 fewer social science credits than social sciences majors, but about 3 credits more than mathematics, computer science, and natural sciences majors. Education majors earned slightly lower grades in social sciences courses than did their classmates who majored in mathematics, computer science, and the natural sciences; the social sciences; and the humanities.

Course Taking in Education

Not surprisingly, those inclined to teach were far more likely to have taken education courses, have taken more of them, and earn higher grades in them than those less inclined to teach. For example, 54 percent of graduates in the pipeline had earned at least one credit in education, compared with 17 percent of graduates not in the pipeline. Ninety-five percent of those who only prepared to teach²⁸ and 80 percent of those who taught had earned credit in education, compared with 27 percent of those who were only considering teaching. In addition, public school teachers were more likely than private school teachers to have earned credit in education courses.

Similarly, graduates who were more likely to have earned credit in education courses also tended to earn more credits. Those in the pipeline earned an average of 28 credits, compared with 6 among those not in the pipeline. Those who taught or only prepared to teach earned an average of 34 to 37 credits, compared with 6 to 7 credits among those who were not in the pipeline at all or who were only considering teaching. Although public school teachers earned no more credits than private school teachers, elementary school teachers earned an average of 43 credits, compared with 28 credits among secondary school teachers. In addition, grades in education courses varied with teaching status to some degree. Those who taught or only prepared to teach earned higher grades in education courses than those who were not in the pipeline or who were only considering teaching. Grades did not vary with the types of schools in which teachers taught.

Thus it appears that graduates' undergraduate academic experiences varied with their inclinations to teach in several ways. Graduates more inclined to teach were more likely than graduates who were less inclined to receive their degrees from public, nondoctorate-granting institutions, which often prepare large numbers of teachers. Also, graduates in the teacher pipeline were less likely than those not in the pipeline to have college entrance examination scores in the top quartile, but tended to have higher GPAs.

•

²⁸ People who had prepared to teach were identified as such by either having a student teaching course recorded on the transcript from the degree-granting institution, or by having become certified to teach within a year of completion of the degree. Thus, they could have been identified as prepared even if transcript information is missing.

Graduates in the teacher pipeline may have tended to have lower entrance examination scores and higher GPAs than their classmates who were not in the teacher pipeline because of differences in the mix of courses they took. Compared with graduates not inclined to teach, those leaning toward teaching were more likely to have taken precollegiate mathematics and education courses, less likely to have taken advanced mathematics and calculus courses, and tended to have earned fewer credits in science and engineering. Overall, students tended to earn higher grades in education courses than in these fields, the humanities, or the social sciences (tables 12–14). Therefore, students who took proportionally more courses in education would tend to have higher GPAs than those who took relatively more courses in these other fields. Thus the mix of courses taken by graduates in various locations in the teacher pipeline may well explain the observed variation in their cumulative and major GPAs.

The role that differences in undergraduate academic achievement or other experiences, however, play in the quality of teachers' instruction is unknown. For example, although elementary school teachers' experiences tended to differ from their nonteaching peers', these teachers also teach more subjects at less sophisticated levels than secondary school teachers. Therefore the differences between their undergraduate academic experiences and those of other college graduates may reflect different needs for professional training. Further studies beyond the scope of this database are needed to examine the relationship between teachers' achievement and course taking in college on the one hand and their abilities to teach children at various levels on the other.

In addition, a number of efforts to establish standards and assessments for quality instructional practice among elementary and secondary school teachers are underway. The Interstate New Teacher Assessment and Support Consortium (INTASC), the National Board for Professional Teaching Standards (NBPTS), and the National Council for Accreditation of Teacher Education (NCATE) are all engaged in projects to develop standards for high quality instructional practice, assessments for determining which teachers have mastered these standards at various grade levels and in various subject areas, and performance standards for teacher education programs.²⁹ These efforts may well provide standards and assessments that will allow direct evaluation of teachers' knowledge and practice, and will therefore offer means of improving both professional preparation and practice. Such assessments, for example, may offer teacher educators insight into the most effective balance of undergraduate subject matter and pedagogical courses for preparing elementary and secondary school teachers. They may also provide analyses such as those presented in this report with information that could guide interpretation of the differences in undergraduate preparation observed in the B&B:93 data.

Early Teaching Experiences: School Characteristics

In addition to their racial—ethnic backgrounds, gender, and academic experiences, other factors are undoubtedly related to the retention of teachers in the profession. This section examines one of these factors: new teachers' early professional experiences.

In the B&B:93/94 interview, graduates who were new teachers were asked several questions about their most recent teaching experience, and their responses may be linked to their plans to continue or leave teaching. Are difficult assignments early in one's teaching career associated with an early exit from the profession? Do schools that can offer particular types of assistance to new teachers make a difference in their future expectations? And, finally, can teacher induction programs help to maintain new teachers' interest in teaching?

First, in the 1994 B&B interview new teachers were asked whether their students or classes were more difficult than others in their school. This question both serves as a subjective measure of whether these teachers were given more difficult assignments than more experienced teachers, and allows analysis of the relationship between the difficulty of teaching and new teachers' plans to remain in the profession. About 14 percent of new teachers felt that their students or classes were more difficult than those of other teachers in their schools (figure 6). Of these, three out of four expected to be teaching in 2 years, about the same proportion as that found among new teachers who did not consider their assignments more difficult than those of their peers (table 15). Although it appears that those who did not feel that their assignments were more difficult were more likely to expect to be teaching in the long term than those who did (65 percent compared with 54 percent), this difference is not statistically significant.

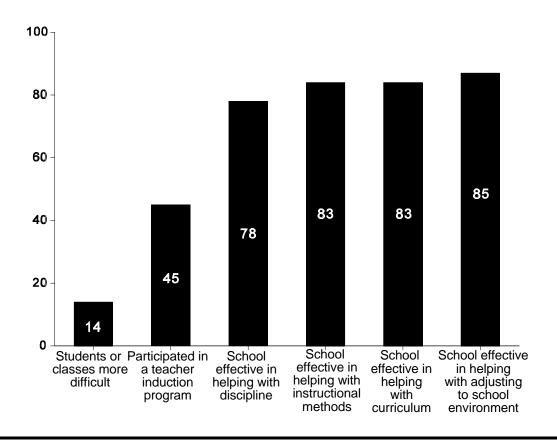

In addition to reporting the relative difficulty of their teaching assignments, the new teachers were asked to report whether their schools were effective in helping new teachers with discipline, instructional methods, curriculum, and adjusting to the school environment. These data serve as a measure of the conditions under which new teachers worked and, again, allow assessment of the relationship between their early teaching experiences and their future expectations. New teachers tended to report that their schools had helped them on all of these issues. For example, 78 percent of new teachers felt that their schools were helpful with discipline, and 85 percent said their schools helped new teachers adjust to the school environment (figure 6).

New teachers' expectations for teaching in the future were sometimes, but not always, linked to their schools' effectiveness at assisting new teachers. In the case of discipline, for example, 79 percent of those who taught in schools that provided assistance expected to be teaching in 2 years, compared with 67 percent of those who did not perceive this support (table 15). Moreover, 67 percent of those whose schools were effective in helping with

35

³⁰An analysis of the 1987–88 SASS data also indicated that, contrary to popular belief, new teachers were not more likely than other teachers in their schools to have difficult assignments (Sharon Bobbitt and Summer Whitener, "Classroom Environment and Support of Beginning Teachers: A Test of the 'Crucible versus Cradle' Theory of Teacher Induction," (Paper presented at the Annual Meeting of the American Educational Research Association, San Francisco, CA, April 1992)).

Figure 6—Of 1992–93 bachelor's degree recipients who were new teachers, percentage who reported that their students or classes were more difficult than others in their schools, that they had participated in teacher induction programs, and that their schools were effective in helping new teachers with various areas of school life: 1994

discipline expected to be teaching long term, compared with 53 percent of those who did not teach in such schools. These findings are consistent with earlier research and conventional wisdom that discipline and classroom management are crucial issues in the first year of teaching.³¹

New teachers who reported that their schools were effective at helping with issues other than discipline were as likely as those who were not in such schools to plan to teach in the future. There was one exception: those who reported that their schools helped new

teachers adjust to their school environments were more likely than those who did not to expect to teach long term. This suggests that receiving support in the intervention areas discussed above may not have a large effect on new teachers' expected persistence in the teacher pipeline.

Another form of institutional support for new teachers is the teacher induction program. Based on the idea that new teachers who are provided with a professional support system will be more capable of adjusting to their environment, performing their job competently, enjoying their work, and therefore more likely to continue teaching,³² an increasing number of school districts and private schools offer induction programs for new teachers.³³ These programs typically assign

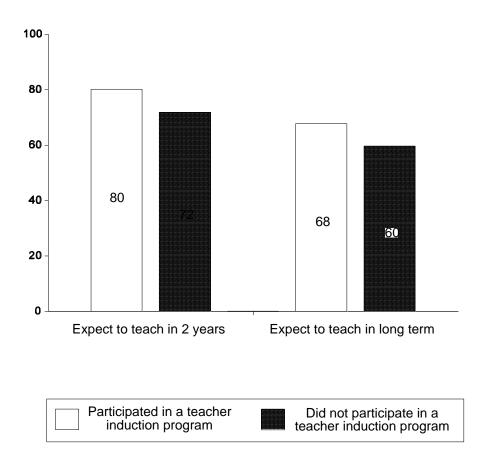

³²Mary Judith Goggins Selke, *Teacher Induction Variables: Impact upon Second Year Teacher Retention* (Ph.D. dissertation, Marquette University, 1992).

³³U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States:* A Statistical Profile, 1993–94.

a new teacher to a mentor or master teacher who can assist them as questions or difficulties arise, but often include workshops or seminars that allow new teachers to share their experiences with each other as well as with their mentors.

Among the 1992–93 graduates who were new teachers, nearly half had participated in a teacher induction program (figure 6). Eighty percent of those who had participated expected to be teaching in 2 years, compared with 72 percent of those who had not participated (figure 7 and table 15). Similarly, while 68 percent of induction program participants expected to be teaching in the long term, 60 percent of nonparticipants had this expectation.

Figure 7—Of 1992–93 bachelor's degree recipients who were new teachers, percentage who expected to be teaching in 2 years and in the long term, by whether they had participated in a teacher induction program: 1994

Thus, the B&B:93/94 survey provides some evidence that teacher induction programs may aid in retaining teachers in the work force in the short term. Among both new teachers who were induction program participants and those who were nonparticipants, however, significantly more expected to be teaching in 2 years than in the long term. Thus, the retention effect of the induction programs may not be enough to counteract the tendency of new teachers to make long-term plans outside of teaching. On the other hand, it is important to note that the amount of support provided by teacher induction programs varies with the content, length, and structure of the program. For example, while some schools may offer formal mentorships combined with workshops, other programs may consist of an introduction to more experienced teachers in the school and encouragement to call if problems arise. Thus, the overall effects of teacher induction programs on new teachers' future expectations may be masked by variability in the programs themselves. In any case, whether those who do not plan to continue teaching do, in fact, drop out of the teacher pipeline will be examined using subsequent waves of data collection.

Summary and Conclusion

The data presented in this report indicate that 1992–93 college graduates who entered the teacher pipeline differed in both demographic and academic terms from their classmates who were not in the pipeline. At several points along the pipeline, women and white graduates were more inclined toward teaching than men and minority graduates, as has been observed historically. Compared with those not in the pipeline, those in the pipeline were less likely to have college entrance examination scores in the top quartile, tended to have higher GPAs, and were more likely to have graduated from public nondoctorate-granting institutions. Graduates in the pipeline also tended to take a different mix of courses than their peers outside the pipeline did. Pipeline graduates were more likely to take both precollegiate mathematics and education courses, less likely to take advanced mathematics or calculus courses, and tended to take fewer science or engineering courses. These differences in course taking may explain, in part, the observed differences in GPAs, because students tended to earn higher grades in education courses than in other disciplines.

Differences between those in the pipeline and those outside the pipeline, however, sometimes overshadowed differences among types of teachers. About 60 percent of the new teachers in the class of 1992–93 taught in elementary schools, compared with 34 percent in secondary schools. On several of the characteristics examined—including gender, college entrance examination scores, cumulative or major GPAs, and credits earned in advanced mathematics or calculus—secondary school teachers did not differ from their classmates who had not entered the teacher pipeline. In addition, secondary school teachers tended to take fewer education courses than their elementary school colleagues. Thus differences between teachers and those outside the pipeline often represented differences between elementary school teachers and those outside the pipeline.

Some have suggested that differences in academic characteristics and experiences between those inclined to teach and those not so inclined may decrease the quality of instruction in elementary and secondary schools.³⁴ These authors have further suggested that these differences are compounded when teachers with higher academic achievement leave the profession at higher rates than those with lower achievement levels. Future B&B:93 data collections will allow examination of both teachers' departure from the profession and others' entry into the profession as the class of 1992–93 matures. Analysts will therefore be able to assess the degree to which differences between the teachers and nonteachers among this college cohort become greater, remain the same, or decrease as graduates move in and out of teaching.

Nevertheless, the import of these differences remains unclear without criteria against which one might judge the adequacy of teachers' academic preparation for their work with children. Further research, such as that being carried out by INTASC, NBPTS, and NCATE, must determine what teachers at various grade levels and in various disciplines need to know in order to instruct their students effectively. Given empirically based criteria for teacher knowledge, B&B:93 data on the undergraduate and graduate education of teachers will allow those interested in elementary and secondary education to evaluate teachers' postsecondary education and performance, and then make informed decisions regarding university education and teacher professional development.

Table Compendium

The table compendium includes the data presented in the essay as well as additional statistics on 1992–93 bachelor's degree recipients and teaching. The tables are arranged in five sections:

- I Which 1992–93 Graduates Entered the Teacher Pipeline?
- II Demographic Characteristics of 1992–93 Bachelor's Degree Recipients in the Teacher Pipeline
- III Academic Experiences of 1992–93 Bachelor's Degree Recipients in the Teacher Pipeline
- IV New Teachers' Experiences in Schools
- V Reasons for Choosing Future Jobs and Plans for the Future

The tables in each section are accompanied by a page of highlights from the tables. The highlights are intended to provide readers with the most interesting information in the tables at a glance, and in some instances repeat information provided in the essay.

Section I: Which 1992–93 Graduates Entered the Teacher Pipeline?

- Among 1992–93 bachelor's degree recipients, ¹ 26 percent had taught since graduation, had prepared to teach, or were considering a teaching career in 1994. ² About 77 percent of education majors had entered the pipeline, at least twice the proportion of pipeline entrants among graduates with any other major. (table C1.1) {t's≥17.40}
- At each point along the teacher pipeline, men were less likely than women to make a commitment to teaching. For example, while half of female pipeline entrants had neither prepared to teach nor taught by 1994, this was the case for two-thirds of their male counterparts. {not prepared t=5.63} Similarly, about one-third of females in the pipeline had taught by 1994, compared with one-fourth of males. (table C1.1) {t=5.18}
- Cumulative undergraduate grade point average was positively associated with preparing to teach and with teaching. Thirty percent or more of pipeline entrants whose cumulative GPAs were 2.75 or higher had taught by 1994, whereas 20 percent or fewer of those with cumulative GPAs between 2.25 and 2.75 did so. {t's≥3.20, k=10, cv=2.81} Similarly, those with cumulative GPAs of 2.75 of higher were more likely than those with lower cumulative GPAs to have prepared but not taught. (table C1.1) {t's≥3.70, k=10, cv=2.81}
- Almost 50 percent of pipeline entrants applied for teaching positions, and of those who applied, 72 percent were offered them. Of those who were offered positions, 90 percent accepted. (table C1.2)
- Pipeline entrants who had earned 120 or fewer semester credits as undergraduates were less likely than their peers who had earned 136 or more credits to have prepared to teach (24 versus 52 to 54 percent). Those with fewer credits were also less likely to have applied for a teaching position (38 versus 55 percent). (table C1.2) {t's ≥ 4.16}
- Compared with pipeline entrants who scored in the top quartile on the SAT or ACT, those scoring in the bottom quartile were more likely to have applied for teaching positions (52 versus 41 percent).³ {t=2.75, k=3, cv=2.39} However, among applicants for teaching positions, there was no association between entrance exam score and the proportion of bachelor's degree recipients who received or accepted a teaching job offer. (table C1.2) {received t's≤1.29; accepted t's≤0.29; k=3, cv=2.39}

¹ Excludes those who either taught in elementary or secondary schools before receiving the 1992–93 bachelor's degree or had been certified to teach 1 year or more before receiving the 1992–93 bachelor's degree.

² Those who had taught since graduation, prepared to teach, or at the time of the interview were considering teaching are referred to as "those who entered the teacher pipeline" or "pipeline entrants" elsewhere in this report.

³ Quartiles were determined relative to B&B graduates, not SAT or ACT population norms.

Table C1.1—Percentage of 1992–93 bachelor's degree recipients who entered the teacher pipeline; and of pipeline entrants, percentage distribution according to status in pipeline, by selected undergraduate academic and demographic characteristics: 1994

¹Includes those who prepared to teach regardless of whether they had taught. Does not include those who taught but did not prepare to teach.
²Includes applications for positions as teacher aides and substitute teachers. Because these positions were not counted as

²Includes applications for positions as teacher aides and substitute teachers. Because these positions were not counted as "teaching" in the pipeline variable, respondents who were offered and accepted these positions were not categorized as having taught in the pipeline variable.

Section II: Demographic Characteristics of 1992–93 Bachelor's Degree Recipients in the Teacher Pipeline

- Among both teachers and nonteachers in the pipeline, those who expected to teach in the future tended to be women. Three out of four of the new teachers who expected to still be teaching in 2 years or in the long term were women. Among nonteachers in the pipeline, 3 out of 4 of those who expected to be teaching in 2 years or in the long term were women. (table C2.1)
- The racial—ethnic makeup of the teacher pipeline was somewhat different from that of other 1992–93 bachelor's degree recipients. The teacher pipeline had a higher proportion of black, non-Hispanic graduates (8 percent versus 5 percent) and a smaller proportion of Asian/Pacific Islander graduates (2 percent versus 6 percent) than the non-pipeline population. (table C2.2) {t=2.07, 5.38; k=1,cv=1.96}
- Among those who were in the teacher pipeline, those who applied for teaching positions were more likely than those who did not apply to come from families where neither parent had pursued education beyond high school (36 percent versus 30 percent). {t=2.57, k=, cv=1.96} Similarly, those who applied for positions were less likely than those who did not apply to come from families where at least one parent had earned an advanced degree (23 percent versus 28 percent). (table C2.3) {t=2.5, k=1, cv=1.96}
- In general, having children appeared to be associated with an interest in teaching. For example, 1992–93 bachelor's degree recipients in the teacher pipeline were more likely to have at least one child (22 percent) than were their peers who were not in the pipeline (17 percent). (table C2.4) {t=3.36, k=1, cv=1.96}
- Graduates in the pipeline earned less than graduates not in the pipeline. Among 1992–93 bachelor's degree recipients, those who were in the teacher pipeline were more likely than those who were not to have earned between \$5,000 and \$14,999 a year. {5K–9,999 t=4.49; 10K–14,999 t=6.66, k=1, cv=1.96} Those in the pipeline were also less likely than those who were not to earn incomes higher than \$25,000. (table C2.6) {25–34,999 t=6.52, k=1, cv=1.96; 35–49,000 t=7.29, k=1, cv=1.96; 50,000+ t=4.53, k=1, cv=1.96}

Section III: Academic Experiences of 1992–93 Bachelor's Degree Recipients in the Teacher Pipeline

- About 10 percent of all 1992–93 bachelor's degree recipients reported that they had taken at least one remedial course in college (table 3.2). Neither teachers nor those who had only prepared to teach were more likely than their classmates outside the pipeline to have reported taking remedial courses. {t's \leq 1.73} However, 14 percent of those who were only considering teaching in 1994 reported having taken remedial courses, compared with 9 percent of those who were not in the pipeline. {t = 3.3, K = 6, CV = 2.64} Education majors were no more or less likely than graduates in other majors to have reported taking remedial courses. {t's \leq 2.07, K = 15, CV = 2.93}
- The amount of time between graduates' entry into postsecondary education and receipt of the bachelor's degree was not associated with their teaching status. {t's on all comparisons among pipeline categories ≤ 1.86 } However, compared with those who taught in public schools, those who taught in private schools were significantly more likely to have earned their degrees in four years or less (57 percent compared with 27 percent) {t = 4.20} and less likely to taken more than 6 years to earn their degrees (15 percent compared with 34 percent) (table 3.7). {t = 3.93}
- Although they took no more time to complete their bachelor's degrees, those more inclined to teach earned more credits toward their bachelor's degrees than their classmates who were less inclined. Those who taught or only prepared to teach earned between 140 and 142 credits, compared with the 133–135 credits earned by those who were only considering teaching or who were not in the pipeline (table 3.8). {t's ≥ 3.18, CV = 2.64, K = 6}
- Among teachers, those who expected to teach in the future were less likely than their colleagues who did not expect to teach in the future both to be enrolled in school in April 1994 and to be enrolled full time. For example, 5 percent of teachers who expected to be teaching in 2 years were enrolled full time, compared with 19 percent of teachers who did not expect to be teaching in 2 years (table 3.12). $\{t = 3.38, \text{ conservative } K = 3, \text{ CV} = 2.39\}$ In contrast, nonteachers who expected to teach in 2 years were more likely than nonteachers who did not expect to teach in 2 years to be enrolled and more likely to be enrolled full time. $\{t's \geq 3.47, \text{ conservative } K = 3, \text{ CV} = 2.39\}$
- Graduates' educational expectations varied consistently with their inclinations to teach. Compared with graduates who were not in the teacher pipeline, those in the pipeline were less likely to expect that bachelor's or professional degrees would be their highest degrees and more likely to expect that master's or doctoral degrees would be their terminal degrees (table 3.12). $\{t's \ge 5.01\}$ Similarly, among those in the pipeline, those who expected to teach in the future were more likely than those who did not expect to teach in the future to expect that their highest degree would be a master's. $\{4 \text{ t's} \ge 2.84; \text{ for each comparison conservative } K = 6, CV = 2.64\}$

¹Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

²These data are students' self-reports of having taken remedial instruction in reading, mathematics, writing, and study skills. The estimates reported can be both higher and lower than those derived from transcript data for at least three reasons: 1) transcript variables report courses taken in specific subject areas, and therefore may result in lower estimates than the self-reports, which combine subject areas, in particular, remedial courses, which schools may not grant credit toward graduation; 2) estimates from transcript data may also be lower because the transcript(s) collected may not include all courses a student had taken; and 3) estimates from transcripts could be higher if graduates' definitions of "remedial instruction" differed from those employed in this study, e.g., they did not consider a precollegiate mathematics course to be remedial instruction.

Table C3.3—Percentage of 1992–93 bachelor's degree recipients whose undergraduate transcripts recorded at least one course attempted in precollegiate mathematics or remedial English, average number of credits earned in each field, and GPA in each field, by selected teaching-related characteristics: 1994

^{*}Excludes bachelor's degree recipients who had taught before receiving the 1992–93 degree or had been certified to teach 1 year or more before receiving the 1992–93 degree.

Section IV: New Teachers' Experiences in Schools

- The types of postsecondary institutions that 1992–93 bachelor's degree recipients attended were associated with the sector of the schools in which they taught. Thirty percent of new teachers who first attended private 4-year postsecondary institutions after high school taught in private schools, compared with 14 percent of those who first attended public 4-year institutions and 8 percent of those who first attended less-than-4-year institutions. {t=2.92, 4.33; k=3; cv=2.39} Similarly, 28 percent of new teachers who received their 1992–93 bachelor's degrees from private nondoctorate-granting institutions taught in private schools, compared with 11 percent of those who graduated from public nondoctorate-granting institutions. (table C4.1) {t=3.14, k=6, cv=2.64}
- Among 1992–93 bachelor's degree recipients, college major was associated with the level at which
 they taught: those who majored in education were more likely than those who majored in the natural
 sciences, mathematics, or computer science to teach in elementary schools (70 percent compared
 with 28 percent), whereas those who majored in the latter areas were more likely to teach in secondary
 schools than were education majors (64 percent and 25 percent, respectively). (table C4.1) {t=6.68,
 5.81}
- Overall, about 9 percent of new teachers had taught a subject they felt unprepared to teach in 1993–94.
 New teachers in both the public and private sectors, teaching at all levels, were about equally likely to have taught a subject they felt unprepared to teach. (table C4.2) {t's≤1.50}
- Forty-five percent of 1992–93 bachelor's degree recipients who were new teachers participated in teacher induction programs. Those teachers who expected to be teaching in 2 years were more likely than those who did not to have participated in teacher induction programs (48 percent versus 36 percent). Similarly, 48 percent of those who expected to be teaching long term were program participants, compared with 40 percent of those who did not expect to be teaching in the long term. (table C4.2) {t=2.25, t=2.00, k=1, cv=1.96}
- New teachers in private sector schools reported that their schools helped with discipline (88 percent) in greater proportions than did new teachers in public schools (75 percent). {t=3.27, k=, cv=1.96} However, public and private school teachers were equally likely to agree that their schools offered assistance with adjusting to the environment, instructional methods, or curriculum. (table C4.2) {t=1.73, t=1.70, t=1.28, k=1, cv=1.96}

Section V: Reasons for Choosing Future Jobs and Plans for the Future

- Those 1992–93 bachelor's degree recipients who were in the teacher pipeline but did not apply for teaching positions cited several reasons for not applying. As many as one-third of the respondents had not applied because they had not taken a teacher certification exam. Men were twice as likely as women not to have applied because another job offered more money (7 percent versus 3 percent). (table C5.1b) {t=2.88, k=1, cv=1.96}
- Those 1992–93 college graduates who were new teachers were less likely than those who were not in the teacher pipeline to report that income potential (34 percent versus 49 percent) or a good starting income (27 percent versus 37 percent) was important to them in selecting a future job. {t=8.73, k=1; t=7.53, k=1, cv=1.96} Prestige and status in a job were also more important to those who were not in the teacher pipeline than to the respondents who were in the pipeline (15 percent versus 7 percent). (table C5.2) {t=8.69, k=1, cv=1.96}
- Among 1992–93 college graduates in the teacher pipeline, those with college entrance examination scores in the top quartile were consistently less likely than those with scores in the bottom quartile to expect to be teaching in the future. {6 t's all≥2.57, k=3, cv=2.39} For example, among teachers, 84 percent of those whose entrance exam scores fell in the bottom quartile expected to be teaching in 2 years, compared with 56 percent of those with scores in the top quartile. (table C5.3)
- Pipeline entrants who were married or had children had different expectations for teaching in the future than did their unmarried peers. Those who were married were more likely than those who were never married to plan to teach in 2 years (53 versus 40 percent) {t=4.50} and in the long term (50 versus 38 percent). {t=4.26} Similarly, whereas half of pipeline entrants who had children expected to be teaching in 2 years or in the long term, 43 percent of those with no children expected to be teaching in 2 years {t=2.23, k=1, cv=1.96} and 41 percent expected to be teaching in the long term. (table C5.3) {t=2.77, k=1, cv=1.96}
- Among 1992–93 bachelor's degree recipients who were new teachers, a positive relationship was found between some forms of assistance a school provided and new teachers' plans for the future. For example, those who participated in teacher induction programs were more likely than those who did not participate to plan to teach in 2 years (80 percent versus 72 percent) and in the long term (68 percent versus 60 percent). {t=2.18, t=1.96, k=1, cv=1.96} New teachers who taught in schools that assisted new teachers with discipline were also more likely than their counterparts who did not teach in such schools to plan on teaching in the future. (table C5.4) {2 yrs t=2.57 k=1; longtm t=2.68, cv=1.96}

Table C5.1a—Of 1992–93 bachelor's degree recipients in the teacher pipeline, percentage who did not apply for a teaching job; and of those who did not apply, percentage who did not apply for various reasons, by selected undergraduate academic and demographic characteristics: 1994

Appendix A

Glossary

This glossary describes the variables used in this report. The variables were taken directly from the NCES B&B:93 Data Analysis System (DAS), an NCES software application that generates tables from the B&B data. A description of the DAS software can be found in appendix B. The labels in parentheses correspond to the names of the variables in the DAS.

The following is a list of variables that appear in this report and the glossary page number on which they can be found. In this list and the glossary that follows variables are listed alphabetically by name within topics.

Academic characteristics 102	Teaching-related characteristics 108
Baccalaureate degree major 102	Classes or students more difficult than
Credits earned in specific subject areas 103	others in school
Credits earned toward bachelor's degree . 104	Expects to be teaching in 2 years 108
Cumulative undergraduate GPA 104	Expects to be teaching long-term 108
Degree-granting institution 104	Highest teacher certification type
Enrollment status April 1994 105	(from all)
Entrance exam scores	Level of school at which taught 109
Ever taken remedial institution 105	Main field taught109
First postsecondary institution attended	Participated in teacher induction
after high school	program
GPA in specific subject areas 105	Reasons for not applying [for teaching
Highest degree expected	position]
Undergraduate GPA in major 106	Discouraged by student teaching 110
Years from postsecondary entry to BA	Had teaching job110
receipt	Haven't taken/passed test 110
	Low pay
Demographic characteristics 107	More money in another job 110
Age received bachelor's degree 107	More prestige in another job 110
Annual salary at April employer 107	Needed more education
Employment status April 1994 107	Not interested in teaching
Gender	Not ready to apply110
Marital status April 1994 107	Other reason
Number of children	Poor teaching conditions 110
Parents' education attainment 108	Teaching jobs hard to get 110
Race-ethnicity	Wanted other occupation 110

Characteristics important in future job 113
Ability to work independently 113
Freedom to make own decisions 113
Good income potential
Good starting income
Intellectually challenging work 113
Interaction with people
Interesting work
Job security
Not having to move
Prestige and status
Time for non-work-related activities 113

Academic characteristics

Baccalaureate degree major (MAJORS3)

MAJORS3 identifies a student's major at the NPSAS sample school during 1992-93. In tables 5, 6, 7, 8, 9, 10, 12, 13, C1.1, C3.1, C3.2, C3.3, C3.4, C3.5, C3.7, C3.8, C3.9, C3.10, C3.11, C3.12, C4.1, C5.1a, and C5.3, this variable was collapsed as follows:

Business and management

Education

Humanities (includes area studies; African American studies; ethnic studies; Spanish; Foreign language, non-European; foreign language, European not Spanish; letters; liberal studies; women's studies; philosophy; religious studies; commercial art; design; speech/drama; film arts; music; and art history/fine arts).

Mathematics, computer science, natural sciences (includes life sciences, physical sciences, mathematics, computer or information science, engineering)

Social sciences

Other (includes health, vocational/technical, other technical/professional, other)

In table C3.6, this variable was collapsed as follows:

Humanities (same as above).

Social sciences

Natural sciences (includes life and physical sciences)

Mathematics, computer sciences

Engineering
Education
Business and management
Other (same as above)

Credits earned in specific subject areas (TCRED__)

Transcripts collected from the NPSAS institutions were analyzed to code courses according to the College Course Map (CCM), a uniform classification of college courses based on national transcript studies. In addition, credit values were normalized to semester hours, and grades earned were normalized to a four-point grade scale. Once classified according to the CCM, courses were aggregated into broad subject areas and the total number of credits earned in each of these broad subject areas was computed. The entries below list the subject areas included in this report, the variable names for the total number of credits earned in each area, and the CCM codes included in each subject area. A subset of the subject areas were chosen for their relevance to the issues addressed in this report. Therefore not all students' courses are represented in these variables.

These variables were used in three ways in this report. Table C3.3 presents the proportion of graduates with transcripts that indicated that a course in precollegiate mathematics or remedial English was attempted, even if no credit was earned. Tables C3.4 and C3.5 present the proportion of graduates whose transcripts indicated that credit was earned in advanced mathematics or calculus, science or engineering, education, social sciences, or humanities. Tables C3.3 to C3.5 also present the average number of credits earned, including only credit totals greater than 0, in each of these subjects areas.

Subject area	Variable name	Course codes	Examples of included courses
Precollegiate mathematics	TCRED08	270100–270199 270801, 270901	Basic concepts of math, pre-algebra, plane geometry
Remedial English	TCRED06	070901, 230402, 231201, 232001, 232004, 320102	Business English, grammar and composition, basic skills
Advanced mathematics or calculus	TCRED10	270600–270799	Calculus, differential equations, Fourier analysis
Science or engineering	TCRED03	140100–149999, 260100–269999, 300101, 400100–400999	Engineering design, biology, astronomy, organic chemistry, physics

¹The courses included in each course code are described in the U.S. Department of Education, Office of Educational Research and Improvement, *The New College Course Map and Transcript Files: Changes in Course-Taking and Achievement*, 1972-1993 (Washington, DC: U.S. Government Printing Office), 1995.

Education	TCRED07	130000–139999	Curriculum theory, educational statistics, special education
Social Sciences	TCRED02	090901–090903, 420100–429999, 440501, 450100–459999, 050100–059999	Mass media, psychology, public policy, anthropology, ethnic studies
Humanities	TCRED01	160100–169999, 230100–239999, 300401–300404, 380100–389999 500502, 500703, 500902	Foreign languages, literature, popular culture, religious studies, art history, music appreciation

Credits earned toward bachelor's degree (TOTCRED)

This is the total number of normalized credits earned and entered for the student on the sample school transcript, including any credits recorded as transferring from another school. This variable was averaged in a few tables and lumped into the following categories in several tables:

120 or fewer 121–135 136–150 More than 150

Cumulative undergraduate GPA (GPACUM)

GPACUM provides respondent's self-reported undergraduate cumulative grade point average. If respondents indicated a grading scale other than a four-point scale, grades were converted to a four-point scale.

Degree-granting institution (SECTOR_B)

SECTOR_B refers to the type of institution that granted the bachelor's degree to respondent.

Public nondoctorate-granting

Public doctorate-granting

Private not-for-profit, nondoctorate-granting

Private not-for-profit, doctorate-granting

Other (includes public less-than-2-year, public 2 year, private not-for-profit less-than-4-year, private for-profit less-than-2-year, and private for-profit 2-years-or-more)

Enrollment status April 1994 (ENROL22)

Respondents were asked about enrollment in any education after bachelor's degree and the dates of enrollment. Based on these dates, monthly enrollment indicators were constructed with the following values:

Not enrolled Enrolled full time Enrolled part time

Entrance exam scores (SATACTQ)

Students' scores on the SAT and ACT college entrance examinations were drawn from institutional records where possible, and otherwise from the student survey. Survey participants with SAT or ACT test scores were assigned a quartile rank relative to the B&B sample. Because some students took only one of the two tests, the two quartile ranks were combined into a single variable. If an SAT score was available, the SAT quartile rank was used because a larger percentage of the sample reported SAT scores. Otherwise, the ACT quartile rank was used. Those with no score available were reported separately. This group includes those who did not take either test, those who may have taken one or both tests but did not report scores, and those whose test status was unknown.

Ever taken remedial instruction (REMEVER)

REMEVER refers to graduates' reports of whether they had taken any remedial or developmental instruction to improve their reading, writing, math, or study skills as undergraduates.

First postsecondary institution attended after high school (FSCTYPE)

This variable indicates the type of institution the respondent first attended after high school graduation. It was created by looking for the earliest postsecondary enrollment after high school. Institutions begun before high school graduation were eligible if enrollment continued after high school graduation. The first institution may or may not be the institution that awarded the bachelor's degree.

Less than 4-year (includes public 2-year, private not-for-profit 2-year, private for-profit 2-year, public less than 2-year, and private for-profit less than 2-year)

Public 4-year

Private not-for-profit 4-year

GPAs in specific subject areas (TGPA__)

Transcripts collected from the NPSAS institutions were analyzed to code courses according to the College Course Map (CCM), a uniform classification of college courses based on national transcript studies. In addition, credit values were normalized to Carnegie units, and grades earned were normalized to a four-point grade scale. Once classified according to the CCM, courses were aggregated into broad subject areas and GPAs were computed for the courses in each subject area. Only subject areas thought to be particularly relevant to the issues addressed in this report are included in this analysis. Therefore, not all students' courses are represented in these variables.

The entries below list the subject areas and the name of the variable in the DAS that provides the GPA earned in each subject area.² See the entry for "Credits earned in specific subject areas" for the courses included in each subject area.

Subject area	Variable name
Precollegiate mathematics	TGPA08
Remedial English	TGPA06
Advanced mathematics or calculus	TGPA10
Science or engineering	TGPA03
Education	TGPA07
Social sciences	TGPA02
Humanities	TGPA01

Highest degree expected (HIGHDEG)

The educational expectations that respondents reported approximately one year after their graduation.

Bachelor's degree (respondent will not pursue further education)

Master's degree

First professional degree (law, medicine, dentistry, theology)

Doctoral degree (e.g., Ed.D., Ph.D.)

Other degree (includes sub-baccalaureate degree and post baccalaureate certificate, e.g., teaching credential)

Undergraduate GPA in major (GPAMAJ)

GPAMAJ refers to graduates' self-reported grade point average in courses earned toward for the undergraduate major. If respondents indicated a grading scale other than a four-point scale, grades were converted to a four-point scale.

Years from postsecondary entry to BA receipt (BATIME2)

Represents the number of months between the date the respondent began postsecondary education and the date of bachelor's degree receipt. If a respondent was missing either date, BATIME2 was set to missing. In a few cases, the value for BATIME2 was less than 30 months; these cases were excluded. BATIME2 was calculated for only those students receiving their first bachelor's in 1992–93.

²The courses included in each course code are described in the U.S. Department of Education, Office of Educational Research and Improvement, *The New Course Map and Transcript Files: Changes in Course-Taking and Achievement, 1972-1993* (Washington, DC: U.S. Government Printing Office), 1995.

Demographic characteristics

Age received bachelor's degree (AGEATBA)

AGEATBA identifies the respondent's age when he/she received his/her bachelor's degree at the NPSAS school.

Annual salary at April employer (APRANSAL)

This variable was constructed by annualizing the wages/salary reported by respondents for their April 1994 job(s). If a respondent worked more than one job, the wages for all jobs were summed. APRANSAL was computed by multiplying the sum of the wages reported per pay period by the number of pay periods within a year.

Employment status April 1994 (EMP0494)

Respondents were asked to provide information for all jobs they held since graduating from college, including the beginning and ending dates. Based on these dates, monthly indicators were constructed characterizing the employment status of each respondent with the following values:

Full time (35 or more hours per week)

Part time (fewer than 35 hours per week)

Unemployed (includes unemployed with benefits and unemployed without benefits)

Out of the labor force (not looking for work)

Gender (RSEX)

B&B:93/94 respondents were asked their gender only if this information was missing from NPSAS and not obvious.

Male

Female

Marital status April 1994 (MARSTAT)

This variable was created using the marital status questions to determine respondent's marital status in April 1994.

Never married

Married/cohabit as married

Divorced/separated/widowed

Number of children (CHILDREN)

CHILDREN refers to a graduate's reported number of children, including adopted, foster, step children, and any children living outside his/her household.

No children

One child or more

Parents' educational attainment (PAREDUC)

PAREDUC refers to the highest grade or level of education completed by either parent.

High school or less (includes less than high school, GED, high school graduation)

Some postsecondary education (includes less than 1 year, 1 year but less than 2 years, 2 years or more, less than 2 years of college, associate's degree, 2 or more years of college)

Bachelor's degree

Advanced degree (includes master's degree or equivalent, first professional degree, other advanced professional degree, doctorate (Ph.D, Ed.D))

Race-ethnicity (RETHNIC)

This variable was created by combining two items in which respondents reported their race (American Indian, Asian, black, white, other) and whether they were of Hispanic origin.

American Indian/Alaskan Native

Asian/Pacific Islander

Black, non-Hispanic

Hispanic

White, non-Hispanic

Teaching-related characteristics

Classes or students more difficult than others in school (ASSIGNME)

ASSIGNME provides a graduate's response to the following question, "The following questions refer to (your current/last) teaching job. (Is/Was) the workload given to you by your school (the students or classes you (teach/taught)) more difficult than those of other teachers at your school?" Responses were as follows:

Yes

No

Not sure

Expects to be teaching in 2 years (TCH2YRS)

TCH2YRS was created to identify those graduates who answered "school teacher" (26) to question OCCIN2YR, "What do you expect your occupation will be two years from now?" Those respondents who reported that they had not taught or prepared to teach and were not considering teaching were coded as missing on TCH2YRS.

Expects to be teaching in long term (TCHLNGTM)

TCHLNGTM identifies respondents who expected to be teaching in two years and whose long term career expectation was the same as their two-year expectation, and those who answered "school teacher" (26) to question OCCLNGTM "What do you expect your occupation will be in the long term?" As was TCH2YRS, TCHLNGTM was defined only for those graduates who had taught, prepared to teach, or at the time of the interview were considering teaching.

Highest teacher certification type (from all) (HICERT)

This variable identifies the highest teaching certification of all certifications held by the respondent. This composite was created using other composites, TCHCRT01–TCHCRT05, to get the highest type.

Other (includes advanced, other, emergency or temporary)

Probationary

Regular

Level of school at which taught (ELLEVEL)

ELLEVEL identifies the type of the school at which the respondent taught for the longest period of time since receiving the B&B BA.

Elementary

Secondary

Combined

Main field taught (FIELD)

This variable identifies a teacher's main teaching field. If a teacher taught in only one field, that field is his/her main field. If a teacher taught in more than one field, his/her main field is the one the teacher listed as his/her main field.

General elementary (includes general elementary and kindergarten)

English, reading (includes English, language arts; and reading)

Mathematics, computer science (includes computer science and mathematics)

Natural sciences (includes biology/life science, chemistry, geology/earth/space science, physics, and general and all other science)

Social studies

Bilingual, ESL, foreign languages (includes bilingual education, French, German, Latin, Spanish, other foreign languages, and English as a second language)

Fine or performing arts (includes art, dance, drama/theater, and music)

Vocational education (includes accounting, agriculture, business, marketing, health occupations, home economics, industrial arts, military science, technical, trade and industry, and other vocational education)

Special education (includes basic skills/remedial education, special ed. for deaf and hard of hearing, special ed. for emotionally disturbed, special ed. for mentally retarded, special ed. for severely handicapped, spec. ed. for specific learning disabil., special ed. for special education)

Other (includes religion, physical education/health, prekindergarten field, and all other education

Participated in teacher induction program (TCHTRAIN)

This variable indicates whether a respondent reported participating in a teacher induction program during the first year of his/her most recent teaching job.

Reason for not applying: (NEVAPP)

Respondents who indicated they had not applied for a teaching position since receiving the baccalaureate degree were asked "What are the reasons you did not apply for a teaching position?" Each of their responses was coded into one of the following categories:

Already had teaching job	(NEVAPP01)
Not interested in teaching	(NEVAPP02)
Needed more education	(NEVAPP03)
Not ready to apply	(NEVAPP04)
Teaching jobs hard to get	(NEVAPP05)
Discouraged by student teaching	(NEVAPP06)
More money in another job	(NEVAPP07)
More prestige in another occupation	

More prestige in another occupation

(NEVAPP08)

Wanted other occupation (NEVAPP09) Low pay (NEVAPP10) Poor teaching conditions (NEVAPP11) Hadn't taken/passed test (NEVAPP12) Other reason (NEVAPP13)

School helped with...

Respondents who had taught were asked whether the schools at which they most recently taught were effective in helping new teachers in each of the following areas:

Student discipline	(DISCIPLE)
Instructional methods	(INSTRUCT)
Curriculum	(CURRICUL)
Adjusting to school environment	
(ADJUST)	

Responses were made on a dichotomous (agree/disagree) scale.

Sector of school at which taught (ELSECTOR)

ELSECTOR identifies the sector of the school at which the respondent taught for the longest period of time since receiving the B&B bachelor's degree.

> Public Private

Status in teacher pipeline (PIPELINE)

PIPELINE was created using the variables TEACH, TEACHTRN, HICERT, TJOB, and B4DEGREE. TEACH, from the B&B:93/94 interview, was used to identify those respondents who had taught or prepared to teach at the preschool, elementary, or secondary level, or who were considering teaching at the time of the B&B:93/94 interview. TEACHTRN was used to determine whether respondents had completed student teaching at the NPSAS institution, and HICERT was used to determine whether respondents had received provisional, regular, or advanced certification to teach. TJOB and B4DEGREE were used to distinguish between those who had taught at the elementary or secondary level and those who had not. The five resulting PIPELINE categories are as follows:

0) Did not teach or prepare to teach and was not considering teaching at time of interview	Includes those respondents who had not taught or not prepared to teach (defined as having either completed student teaching at the NPSAS institution or earned provisional, regular, or advanced certification to teach) and at the time of the B&B:93/94 interview were not considering teaching
1) Was considering at time of interview but neither prepared nor taught	Includes those respondents who, at the time of the B&B:93/94 interview, were considering teaching but had neither prepared to teach nor taught
2) Did not prepare, taught	Includes those respondents who had taught but had not prepared to teach
3) Prepared but did not teach	Includes those respondents who had prepared to teach but had no taught
4) Prepared and taught	Includes those respondents who had prepared to teach and taught

For the purposes of this analysis, respondents who had taught before receiving the 1992-93 bachelor's degree or who had been certified one year or more before receiving the 1992-93 degree were eliminated from the sample using the variable TEACHUNV (see below) as a filter (where filter condition was TEACHUNV = 1). Then, TEACH (see below) and PIPELINE were used to create the following rows used in most of the tables presented in this report:

Not in teacher pipeline	TEACH = 0 (same as $PIPELINE = 0$)
In teacher pipeline	TEACH = 1
Nonteachers	PIPELINE = 1 or 3
Considering only	PIPELINE = 1
Prepared only	PIPELINE = 3
Taught	PIPELINE = 2 or 4

In tables 2 and C1.2, PIPELINE categories 3 and 4 were combined to identify those graduates who had prepared to teach.

Taught or certified before receiving BA (TEACHUNV)

This composite identifies respondents who reported that they had not taught school prior to receiving the B&B bachelor's degree and that they had not been certified to teach one year or more before obtaining the B&B bachelor's degree. This variable was used to restrict the sample for this analysis to those graduates who could enter teaching for the first time.

Teaching filter variable (TEACH)

TEACH provides respondents' answers to the following question: "Have you ever trained or worked as a teacher at the preschool, grade school, or high school level, or are you currently considering teaching?" Those who answered "no" (TEACH=0) were considered outside the teacher pipeline (PIPELINE=0). Those who answered "yes" (TEACH=1) were further disaggregated in the PIPELINE variable. See entry "Status in the teacher pipeline" for further detail.

Took student teaching (TEACHTRN)

This variable, taken from student transcript data, identifies respondents who took at least one student teaching course as part of their work toward the 1992–93 bachelor's degree. This variable was used in this analysis to create the composite variable PIPELINE.

Whether accepted offer (ACCOFFER)

ACCOFFER indicates whether respondent reported accepting an offer for a teaching position.

Yes

No

Whether applied for teaching position (APPLICAT)

APPLICAT refers to respondents' reports of the number of applications for teaching positions they had submitted since graduation.

Whether offered teaching position (OFFERS)

OFFERS refers to graduates' reports of the number of offers for teaching positions they received.

Whether taught before receiving 1992–93 bachelor's degree (B4DEGREE)

Respondents who reported that they had taught or prepared to teach or that at the time of the B&B:93/94 interview they were considering teaching were asked, "Were you employed as a teacher by a school or district other than as a student or substitute teacher before completing your degree requirements?" B4DEGREE provides respondents' answers to this question and was used to develop both PIPELINE and TEACHUNV.

Whether taught since receiving 1992–93 bachelor's degree (TJOB)

Respondents who reported that they had taught or prepared to teach or that at the time of the B&B:93/94 interview they were considering teaching were asked: "Have you held any teaching jobs in a school since earning your degree? (Do not include student teaching, substitute teaching, tutoring, or teacher's aides)." TJOB provides respondents' answers to this question and was used to develop PIPELINE.

Characteristics important in future job

Job characteristics important in determining future work (CHOICE__)

For each of several job characteristics, respondents were asked whether the characteristic was important to them in determining the type of work they planned to do in the future. Possible responses were yes and no. Job characteristics are listed below:

Good starting income	(CHOICE02)
Good income potential	(CHOICE03)
Job security	(CHOICE04)
Prestige and status	(CHOICE05)
Interesting work	(CHOICE06)
Intellectually challenging work	(CHOICE07)

Freedom to make own decisions

(CHOICE08)

Interaction with people (CHOICE09)
Ability to work independently (CHOICE010)
Not having to move (CHOICE011)

Time for non-work-related activities

(CHOICE012)

Appendix B

Technical Notes and Methodology

Baccalaureate and Beyond Longitudinal Study²

The Baccalaureate and Beyond Longitudinal Study (B&B:93) tracks the experiences of a cohort of college graduates who received the bachelor's degree during the 1992–93 academic year. This group's experiences in the areas of further education and degree completion, employment, public service, family formation, and other adult decisions will be followed for 12 years. B&B:93 will provide data to assess the outcomes of postsecondary education, including graduate and professional program access, labor market experience, and rates of return on investment in education.

Participants in the 1993 National Postsecondary Student Aid Study (NPSAS:93) who received their bachelor's degrees between July 1992 and June 1993 form the base sample for the B&B study. Approximately 12,500 NPSAS:93 respondents were identified as eligible for the first followup survey, which was conducted between July 1993 and December 1994 (roughly one year after participants' graduation). Approximately 1,500 members of this initial sample were determined to be ineligible at the time of the followup interview, and about 900 others were not interviewed (usually because they could not be located or refused to participate), generating a final interviewed sample of 10,080 college graduates. Table B1 shows the response rates for the survey according to gender, race, and age at degree receipt. As shown in the table, an overall response rate of 92 percent was achieved for the first followup survey.

The NPSAS:93 sample, while representative and statistically accurate, was not a simple random sample. Instead, the survey sample was selected using a more complex three-step procedure with stratified samples and differential probabilities of selection at each level. First, postsecondary institutions were initially selected within geographic strata. Once institutions were organized by zip code and state, they were further stratified by control (i.e., public, private not-for-profit, or private for-profit) and degree offering (less-than-2-year, 2- to 3-year, 4-year nondoctorate-granting, and 4-year doctorate-granting). For more detailed information about the NPSAS:93 survey, refer to the *Methodology Report for the National Postsecondary Student Aid Study, 1992–93* (Washington, DC: U.S. Department of Education, National Center for Education Statistics, 1995). For more information on sampling procedures for the Baccalaureate and Beyond First Followup Study (B&B:93/94), consult the U.S. Department of Education, National Center for Education Statistics, *Baccalaureate and Beyond Longitudinal Study: 1993/94 Methodology Report*, NCES 96-149 (Washington, DC: July 1996).

²The text in this section is based on excerpts from *Baccalaureate and Beyond Longitudinal Study: 1993/94 Methodology Report*, NCES 96-149 (U.S. Department of Education, National Center for Education Statistics, Washington, DC: July 1996).

³The NPSAS universe excludes institutions offering only correspondence courses, institutions enrolling only their own employees, and U.S. service academies.

Table B1—Percentage distribution of the 1993 Baccalaureate and Beyond (B&B:93/94) sample according to case disposition, by selected demographic characteristics: 1994

Transcript Data

The B&B:93/94 data collection included a student transcript study. Transcripts were sought for all B&B:93 sample members from the NPSAS sample institution from which they received their bachelor's degrees. Transcripts were requested from the NPSAS institution only. Credits that students received at other institutions were included in the B&B data only when supplied by the NPSAS institution. Ninety-nine percent of eligible NPSAS institutions responded, resulting in a student-level collection rate of 98 percent.

Institutions were also asked to provide course catalogs and information regarding their credit and grading systems. This information was used to categorize several parts of course records on the transcripts. Course catalogs allowed coders to classify courses within the College Course Map, a course classification system designed by the U.S. Department of Education.⁴ Information on credit and grading systems allowed the normalization of credits and grades across institutions.

Accuracy of Estimates

The statistics in this report are estimates derived from a sample. Two broad categories of error occur in such estimates: sampling and non-sampling errors. Sampling errors occur because

⁴U.S. Department of Education, Office of Educational Research and Improvement, *The New College Course Map and Transcript Files: Changes in Course-Taking and Achievement, 1972–1993* (Washington, DC: U.S. Government Printing Office), 1995.

observations are made only on samples of students, not on entire populations. Nonsampling errors occur not only in sample surveys but also in censuses of entire populations.

Nonsampling errors can be attributed to a number of sources: inability to obtain complete information about all students in all institutions in the sample (some students or institutions refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information; mistakes in recording or coding data; and other errors of collecting, processing, sampling, and imputing missing data.

Data Analysis System

The estimates presented in this report were produced using the B&B:93/94 Data Analysis System (DAS). The DAS software makes it possible for users to specify and generate their own tables from the B&B data. With the DAS, users can replicate, modify, or expand upon the tables presented in this report. In addition to the table estimates, the DAS calculates both standard errors appropriate for the study's complex sampling procedures and weighted sample sizes for these estimates.⁵ For example, table B2 presents the standard errors that correspond to table C1.1 in the compendium, and table B3 presents standard errors for estimates presented in Table C4.1. If the number of valid cases is too small to produce a reliable estimate, the DAS prints the message "low-N" instead of the estimate.

In addition to generating tables, the DAS will also produce a correlation matrix of selected variables, which statistical software packages can use to estimate linear regression models. In addition to the correlation matrix, the DAS produces a table of design effects (DEFTs) for all the variables in the correlation matrix. Since most statistical software packages compute standard errors for regression coefficients based on an assumption of simple random sampling, the standard errors must be adjusted with the design effects to take the complex sample design into account.

For more information about the NCES B&B:93/94 Data Analysis System, contact:

Aurora D'Amico National Center for Education Statistics 555 New Jersey Avenue, NW Washington, DC 20208-5652

(202) 219-1365

Internet address: Aurora_D'Amico@ED.GOV

⁵The B&B sample is not a simple random sample and, therefore, simple random sample techniques for estimating sampling error cannot be applied to these data. The DAS takes into account the complexity of the sampling procedures and calculates standard errors appropriate for such samples. The method for computing sampling errors used by the DAS involves approximating the estimator by the linear terms of a Taylor series expansion. The procedure is typically referred to as the Taylor series method.

Statistical Procedures

Since the estimates in this report are based on a sample, observed differences between two estimates can reflect either of two possibilities: differences that exist in the population at large and are reflected in the sample, or differences due solely to the composition of the sample that do not reflect underlying population differences. To minimize the risk of erroneously interpreting differences due to sampling alone as signifying population differences (a Type I error), the statistical significance of differences between estimates was tested using Student's t statistic. Differences between estimates were tested using the following formula:

$$t = \frac{E_1 - E_2}{\sqrt{se_1^2 + se_2^2}}$$

where E_1 and E_2 are the estimates to be compared and se_1 and se_2 are their corresponding standard errors. Note that this formula is valid only for independent estimates. When the estimates were not independent, (for example, when making comparisons within a percentage distribution), a covariance term was added to the denominator. Differences were judged to be statistically significant when the value of t was sufficiently large that the probability of a Type I error was no more than 5 percent (a significance level of .05). This procedure involved calculating Student's t for the difference between the means or proportions of interest, then comparing this value with published tables of critical values of t corresponding to a two-tailed hypothesis test with a significance level of .05.

There are hazards in reporting statistical tests for each comparison. First, comparisons based on large *t* statistics may appear to merit special attention. This can be misleading since the magnitude of the *t* statistic is related not only to the observed differences in means or percentages

^{*}Although 33 percent of black, non-Hispanic graduates entered the pipeline, only 20 percent taught, so tables that include only teachers have too few black, non-Hispanics to report estimates.

but also to the number of students in the categories under comparison. Hence, a small difference between two large groups would produce a large *t* statistic.

A second hazard in reporting statistical tests for each comparison occurs when making multiple comparisons among categories of a single variable. For example, when making paired comparisons among different undergraduate fields of study, the probability of a Type I error for these comparisons taken as a group is larger than the probability for any single comparison. When more than one difference between groups of related characteristics or "families" are tested for statistical significance, one must apply a standard that assures a level of significance for all of those comparisons taken together.

Comparisons were made in this report only when $p \le .05 \div k$ for a particular pairwise comparison, where that comparison was one of k tests within a family. This guarantees both that the individual comparison would have $p \le .05$ and that for k comparisons within a family of possible comparisons, the significance level for all the comparisons will sum to $p \le .05$.

For example, in a comparison of the percentages of males and females who enrolled in postsecondary education only one comparison is possible (males versus females). In this family, k=1, and the comparison can be evaluated without adjusting the significance level. When students are divided into five racial—ethnic groups and all possible comparisons are made, then k=10 and the significance level of each test must be $p \le .05 \div 10$, or $p \le .005$. The formula for calculating family size (k) is as follows:

$$k = \frac{jx(j-1)}{2}$$

where j is the number of categories for the variable being tested. In the case of race–ethnicity, there are five racial–ethnic groups (American Indian, Asian/Pacific Islander, black non-Hispanic, Hispanic, and white non-Hispanic), so substituting 5 for j in equation 2,

$$k = \frac{5x(5-1)}{2} = 10$$

124

⁶The standard that p ≤ .05/k for each comparison is more stringent than the criterion that the significance level of the comparisons should sum to p≤.05. For tables showing the t statistic required to ensure that p≤.05/k for a particular family size and degrees of freedom, see Olive Jean Dunn, "Multiple Comparisons Among Means," *Journal of the American Statistical Association* 56: 52–64.
